Synthesis of Pentyl Enanthate via Fischer Esterification

Aidan Leonard, Dr. Kawagoe, Dr. MacPherson

03/06/26

1 Introduction

The objective of this experiment is to synthesize pentyl enanthate via Fischer Esterification by reacting 1-pentanol with enanthic acid in the presence of catalytic concentrated sulfuric acid. The product will be characterized and analyzed by odor analysis, ATR-IR, 100 MHz ^{1}H NMR, and GC-MS.

2 Reaction Scheme

3 Table of Reagents and Products

Compound	MW (g/mol)	Density (g/mL)	B.P (°C)	Equiv	Amount	mmol
Enanthic Acid	130.18	0.918	223	1.0	5.589 g / 6.09 mL	42.9
1-Pentanol	88.15	0.811	138	3.0	11.353 g / 14.00 mL	128.8
Sulfuric Acid	98.08	1.84	–	cat.	5 drops	–
Diethyl Ether	74.12	0.710	34.6	solv.	–	–
Pentyl Enanthate	200.32	0.86	245 - 246	–	8.6 g / 10.0 mL	42.9

4 Experimental Procedure

4.1 Apparatus

- Reflux
- Simple Distillation
- Rotovap

4.2 Procedure

- In a 25 mL round-bottom flask, add 5.589 g (6.09 mL) of enanthic acid followed by 11.353 g (14.00 mL) of 1-pentanol and a stir bar.
- While stirring, slowly add 5 drops of concentrated sulfuric acid.
- Gently reflux for 60 minutes, then allow the mixture to cool to room temperature.
- Chill the product in an ice bath then transfer the mixture to a separatory funnel using 20 mL total of diethyl ether to aid in the process.
- Quench the organic layer with 15 mL of iced cold DI water and collect the organic layer. Do this three times.
- Neutralize and extract the organic layer with small portions of a saturated sodium bicarbonate solution until the production of CO_2 gas ceases.
- Wash the remaining organic layer with a brine solution then dry the organic over anhydrous sodium sulfate followed by gravity filtration.
- Gently boil off the ether solution in a 50 mL beaker blowing a light stream of air over the top to obtain the crude pentyl enanthate.
- Purify the product with simple distillation.
- Analyze the purified product by odor assessment, ATR-IR, ^{1}H NMR (100 MHz), and GC-MS to confirm ester formation and purity.
